

ABSTRACT OF THE DISCLOSURE

In order to eliminate impairment due to a disconnection
and to make driving at high speed possible, a semiconductor
5 device is provided which includes a plurality of pixels,
each having a switching element, arrayed two-dimensionally,
which includes a plurality of common lines connected to the
switching elements arrayed in a direction, and which drives
the switching elements. A plurality of driving devices for
10 applying a control signal are connected to the common lines.
